SERUM ANTIBODY DETECTION FOR MERKEL CELL CARCINOMA

Non-Discrimination Statement and Multi-Language Interpreter Services information are located at the end of this document.

Coverage for services, procedures, medical devices and drugs are dependent upon benefit eligibility as outlined in the member's specific benefit plan. This Medical Coverage Guideline must be read in its entirety to determine coverage eligibility, if any.

This Medical Coverage Guideline provides information related to coverage determinations only and does not imply that a service or treatment is clinically appropriate or inappropriate. The provider and the member are responsible for all decisions regarding the appropriateness of care. Providers should provide BCBSAZ complete medical rationale when requesting any exceptions to these guidelines.

The section identified as "Description" defines or describes a service, procedure, medical device or drug and is in no way intended as a statement of medical necessity and/or coverage.

The section identified as "Criteria" defines criteria to determine whether a service, procedure, medical device or drug is considered medically necessary or experimental or investigational.

State or federal mandates, e.g., FEP program, may dictate that any drug, device or biological product approved by the U.S. Food and Drug Administration (FDA) may not be considered experimental or investigational and thus the drug, device or biological product may be assessed only on the basis of medical necessity.

Medical Coverage Guidelines are subject to change as new information becomes available.

For purposes of this Medical Coverage Guideline, the terms "experimental" and "investigational" are considered to be interchangeable.

SERUM ANTIBODY DETECTION FOR MERKEL CELL CARCINOMA (cont.)

Description:

Merkel cell carcinoma (MCC) of the skin is a rare, aggressive cutaneous malignancy that predominantly affects older adults with light skin types and as a propensity for local recurrence and regional lymph node metastases. Merkel cell polyomavirus (MCPyV) is suspected to cause the majority of cases of MCC.

Serum antibodies against the major MCPyV capsid protein (VP1) are detected in the general population, whereas antibodies against MCPyV oncoproteins (T-antigens) have been reported specifically in individuals with MCC. The Merkel SmT Oncoprotein Antibody Titer and the Merkel Virus VP1 Capsid Antibody tests are by the University of Washington, Department of Laboratory Medicine. Both tests are reported as a numerical result for therapeutic decision making for MCC.

Criteria:

- Serum antibody detection for the MCPyV T-antigen and VP1 for the diagnosis, prognosis and/or recurrence of MCC is considered ***experimental or investigational*** based upon:
 1. Insufficient scientific evidence to permit conclusions concerning the effect on health outcomes, and
 2. Insufficient evidence to support improvement of the net health outcome, and
 3. Insufficient evidence to support improvement of the net health outcome as much as, or more than, established alternatives, and
 4. Insufficient evidence to support improvement outside the investigational setting.

These tests include, *but are not limited to*:

- Merkel SmT Oncoprotein Antibody Titer
- Merkel Virus VP1 Capsid Antibody
