PHOTODYNAMIC THERAPY FOR CHOROIDAL NEOVASCULARIZATION

Non-Discrimination Statement and Multi-Language Interpreter Services information are located at the end of this document.

Coverage for services, procedures, medical devices and drugs are dependent upon benefit eligibility as outlined in the member’s specific benefit plan. This Medical Coverage Guideline must be read in its entirety to determine coverage eligibility, if any.

This Medical Coverage Guideline provides information related to coverage determinations only and does not imply that a service or treatment is clinically appropriate or inappropriate. The provider and the member are responsible for all decisions regarding the appropriateness of care. Providers should provide BCBSAZ complete medical rationale when requesting any exceptions to these guidelines.

The section identified as “Description” defines or describes a service, procedure, medical device or drug and is in no way intended as a statement of medical necessity and/or coverage.

The section identified as “Criteria” defines criteria to determine whether a service, procedure, medical device or drug is considered medically necessary or experimental or investigational.

State or federal mandates, e.g., FEP program, may dictate that any drug, device or biological product approved by the U.S. Food and Drug Administration (FDA) may not be considered experimental or investigational and thus the drug, device or biological product may be assessed only on the basis of medical necessity.

Medical Coverage Guidelines are subject to change as new information becomes available.

For purposes of this Medical Coverage Guideline, the terms “experimental” and “investigational” are considered to be interchangeable.

PHOTODYNAMIC THERAPY FOR CHOROIDAL NEOVASCULARIZATION (cont.)

Description:

Photodynamic Therapy (PDT):
Photodynamic therapy (PDT) is a treatment modality designed to selectively occlude ocular choroidal neovascular tissue. The therapy is a 2-step process, consisting initially of an injection of the photosensitizer Visudyne® (verteporfin), followed 15 minutes later by laser treatment to the targeted sites of neovascularization in the retina. The laser treatment selectively damages the vascular endothelium. Individuals may be re-treated if leakage from choroidal neovascularization (CNV) persists. Intravitreal corticosteroids have been investigated as an adjunct to verteporfin PDT.

Anti-Vascular Endothelial Growth Factors (VEGF) Inhibitors:
Antagonists that bind to and inhibit vascular endothelial growth factor (VEGF) to prevent the formation of new blood vessels. Anti-VEGF inhibitors are also referred to as angiogenesis inhibitors.

- Eylea® (aflibercept)
- Lucentis® (ranibizumab)
- Macugen® (pegaptanib sodium)
- Avastin® (bevacizumab)

Age-Related Macular Degeneration (AMD):
Gradual painless loss of central vision due to a breakdown of a portion of the retina known as the macula.

The non-neovascular form (also known as dry, nonexudative, or atrophic) is more common and progresses slowly, characterized by the accumulation of small, yellowish deposits called drusen that form within the layers of the retina. Non-neovascular AMD may suddenly develop into neovascular AMD.

The neovascular form (also known as wet, exudative or disciform) is characterized by choroidal neovascularization, the proliferation of fine blood vessels at the back of the eye that begin to leak or exude fluid, causing hemorrhage, swelling and scar tissue which may result in permanent central vision loss within days or weeks.

Central Serous Chorioretinopathy:
A disease in which a serous detachment of the macula occurs due to leakage of fluid from the choriocapillaris through the retinal pigment epithelium. Choroidal neovascularization may occur as a secondary complication.

Choroidal Hemangioma:
An uncommon, benign vascular tumor, manifesting as an orange-red mass in the posterior pole of the eye. Visual loss may be progressive and irreversible because of chronic foveal detachment.

Description: (cont.)

Choroidal Neovascularization (CNV):
The proliferative growth of abnormal new blood vessels, called neovascular membranes, originating from the choroid (between the retina and the sclera) that begin to leak or exude fluid, causing hemorrhage, swelling and scar tissue which can lead to rapid irreversible loss of vision.

Pathologic Myopia:
Abnormal elongation of the eye associated with severe near-sightedness. It can result in a progressive, severe loss of vision, frequently related to the development of CNV.

Presumed Ocular Histoplasmosis:
Characterized by tiny choroidal scars, peripapillary scarring and exudation or hemorrhage from choroidal lesions in or near the macula along with a positive skin test for histoplasmosis and miliary opacities of the lungs.

Criteria:

- Photodynamic therapy (Visudyne plus laser) as monotherapy is considered medically necessary for treatment of choroidal neovascularization associated with ANY of the following conditions:
  1. Age-related macular degeneration
  2. Chronic central serous chorioretinopathy
  3. Choroidal hemangioma
  4. Pathologic myopia
  5. Presumed ocular histoplasmosis

- Photodynamic therapy as monotherapy for all other indications not previously listed; or if above criteria not met is considered experimental or investigational based upon:
  1. Insufficient scientific evidence to permit conclusions concerning the effect on health outcomes, and
  2. Insufficient evidence to support improvement of the net health outcome, and
  3. Insufficient evidence to support improvement of the net health outcome as much as, or more than, established alternatives.
PHOTODYNAMIC THERAPY FOR CHOROIDAL NEOVASCULARIZATION  (cont.)

Criteria: (cont.)

- Photodynamic therapy when used in combination with one or more anti-vascular endothelial growth factor (anti-VEGF) therapies for treatment of choroidal neovascularization associated with all other ophthalmologic conditions is considered experimental or investigational based upon:

  1. Insufficient scientific evidence to permit conclusions concerning the effect on health outcomes, and
  2. Insufficient evidence to support improvement of the net health outcome, and
  3. Insufficient evidence to support improvement of the net health outcome as much as, or more than, established alternatives.

These conditions include, but are not limited to:

- Age-related macular degeneration
- Chronic central serous chorioretinopathy
- Choroidal hemangioma
- Pathologic myopia
- Presumed ocular histoplasmosis

- Intravitreal corticosteroid injection as an adjunct to photodynamic therapy is considered experimental or investigational based upon:

  1. Insufficient scientific evidence to permit conclusions concerning the effect on health outcomes, and
  2. Insufficient evidence to support improvement of the net health outcome, and
  3. Insufficient evidence to support improvement of the net health outcome as much as, or more than, established alternatives, and
  4. Insufficient evidence to support improvement outside the investigational setting.
